

## Non Local Electron Displacement Theory

*By BazookaJeff*

Bitcoin: 12VbTWc4hLSqhAs1LEDBWKdBfaDCC98DMc

Almost a hundred years ago, a Latvian born backyard scientist discovered what he described as a lost secret of nature that had been forgotten for millennia. Upon his death, his secret remained a mystery; however, there were clues as to what he had found. That scientist, Edward Leedskalnin, produced a physical monument to this discovery as well as books and journals which discussed his rediscovered law of nature. As far as I can tell, there have been no other scientists to accurately describe the phenomenon that he calls “magnecity.” In this paper, I will try to explain the phenomena at length and produce a logical explanation as to how the phenomenon works and what we can do with it.

### Electron Flow Through Leedskalnin’s Lens

**Edward Leedskalnin’s  
Magnetic Gyroscope**

In Leedskalnin’s model, tiny particles called “magnets” freely flow around the Earth in a large magnetic flux i.e. North Pole and South Pole. These opposing magnetic particles spin and move in opposite directions of one another. Further, in his model, they are constantly at odds with one another and are in every object in space. With this understanding, all objects are magnetic and thus can be manipulated. Just as a permanent magnet can have its poles switched with a larger magnet, all objects in space can have their poles reversed as well. What’s more, these objects can create a magnetic relationship with one another with distance seemingly having no issue at all. That said, if you were to have a heavy rock, you could in theory change its poles so as to be more

attracted to the moon than the earth thereby making it weigh “less” (even though

the ‘weight’ and mass have not changed at all). Leedskalnin believed that these magnets could be harvested and used for this purpose as well as creating electricity. In his model, these magnets could be captured by electromagnets and crystal radios (electricity catchers). The way that they would

do this is by use of a magnetic gyroscope which captures these free flying magnets and focuses them into whatever object he pleased. Evidence of this

phenomenon can be found at his physical monument “Coral Castle” near Miami Florida. I hypothesize that indeed Leedskalnin was able to flip the polarity of these gigantic rocks with his magnetic gyroscope; however, I think that his understanding of the phenomena can be better understood and explained with the principle of quantum non-locality.<sup>1</sup>

All that has to be done is to start the magnets to run in on orbit, then they will never stop.

**Leedskalnin Believed that the “magnets” were in a perpetual orbit**

### **Modern Non Local Phenomena**

In 1997, scientists conducted an experiment in which particles were shown to exhibit the principle of “non-locality.” This phenomenon had been known since the time of Einstein as he described it as “spooky action at a distance.” In short, light particles under certain circumstances created a relationship with one another so as to instantly move when another particle was in sync with it at a distance of over 7 miles. Given the distance, it is surmised that no matter the distance, these particles would still have a relationship with one another. We must ask ourselves, if these particles can have a relationship, could the entire cosmos?

### **Electron Flow Through a Non Local Lens**

Given that particles can have a relationship that is non local, I surmise that electrons have a web of non-local connection that spans the entire cosmos. Further, I also surmise that this phenomenon is what is causing what Plato referred to as “the realm of becoming.” Like a cosmic game of musical chairs, all electrons are moving in a constant spinning waltz whereby they are moving from one place to another from moment to moment as they change from a particle to a wave. With this scenario, these electrons are moving from atom to atom and are a fundamental property of our universe. Indeed, all objects would have the potential to capture more of these electrons and thereby become more or less magnetic. Further, I also surmise that we can spin

these electrons from atom to atom which thereby accumulates them into the object that is spinning and thereby makes it change its inherent magnetic properties. Permanent magnets already exhibit this “extra electron” and thus show magnetic properties. Under this model, all objects are magnetic, have the possibility of becoming more magnetic, can exhibit a perpetual relationship with each other, and can have a relationship with other objects at seemingly incomprehensible distances.

**Magnetic Toroidal Flux in Objects**

### **Implications of This Theory**

Given the colossal use of oil in the world and the pollution that it causes, this theory may change the doomed course of human history. I surmise that we should look up to the skies for our solution. Like Tesla before me, I wager that the ionosphere is a perfect natural electron accumulator that we can non-locally use to power our world. Since it is natural, abundant, and non-polluting, it is the perfect renewable energy source for our future. It was said that Leedskalnin could power a light bulb with his rudimentary magnetic gyros and crystal radios (energy catchers). I imagine a future where there are much larger gyros powering enormous cities. What is more, we can move large objects with this theory and even propel ourselves at great speeds in new vehicles with it since we

**Professor Eric Laithewaite’s Anti-Gravity Gyroscope. Note the natural Toroidal flow of the Gyroscope.**

could simply create a non-local magnetic relationship with a distant moon or planet to move forward. One such device was developed by a Scottish backyard scientist Sandy Kidd who worked closely with the late Imperial College professor Eric Laithwaite of England. I surmise that this gyroscopic device could be made larger and more perfect with this theory and thereby make rockets and other combusive propelling devices obsolete. I do not believe this theory is at odds with any known forces in our universe and therefore it can be tested and is logically sound. This theory is not saying that there is “free energy” but instead that there is an abundance of energy that can be harvested from the right sources. We are already seeing this today with the so-called Earth engines that are being mass produced at IE Energy. As far as I can tell, the scientist at IE Energy know that they are using electrical energy and permanent rare earth magnets to produce more electric energy than is being put into the device.<sup>2</sup> I believe my theory accurately explains this phenomenon and allows for us to utilize it more effectively.

**Sandy Kidd's Gyroscopic Device**

Unfortunately, there are other implications of this theory that are not as rosy as my idea of using it as an energy source. I believe that there are two other related phenomena that go hand in hand with this one. The Dzhanibekov effect is one phenomenon that can be explained with non-local electron displacement. In it, an object with three moments of inertia flips i.e. a tennis racket being flipped in the air to the other side. This phenomenon even happens in microgravity with recent experiments on the tennis racket effect on the International Space Station. With non-local electron displacement, the positive and negative polarities fight each other on a regular basis. Taken further, the tennis racket effect could also be extrapolated to the Earth as it too is physical object. I think that this is one of the reasons that even Albert Einstein was a fan of the “pole shift theory” as he wrote the forward in Charles Hapgood's book, *Earth's Shifting Crust* which discussed pole shift theory in depth. If pole shifting does indeed occur, it would happen on a regular basis and wreak havoc on the Earth. That is, the poles would shift just as the tennis racket and would then make a magnetic relationship with the nearest object – in this case the moon. I believe that this has already taken place numerous times in history and can be accounted for in our historical records i.e. Solon's Atlantis and Aristotle's circumstantial evidence of muddy waters from the cataclysm. If indeed pole shifts do occur, the ramifications of this would be epic as there could be eras of human history that have been erased in a very short time.

## **Conclusion**

I find it odd that the Central Intelligence Agency would classify a book on pole shift theory. Even today, Chan Thomas's book, *The Adam and Eve Story* is sanitized and partially declassified on their website.<sup>3</sup> Given this, to me there must be more to this theory. What's more is that Eric Laithwaite proved that gyroscopes could exhibit antigravity like effects on a repeated basis. In his experiments, a 45 pound gyroscope could be lifted by even a small child with one hand above their head with ease.<sup>4</sup> I think that this alone shows that there is something more at play than simple Newtonian mechanics and indeed we must rethink the nature of reality and the laws that we think inherently exist in the cosmos.
